Ethics, AI Trustworthiness & Security Guidelines

Section 1: AI Ethics and Trustworthiness

All projects proposing automated artificial intelligence architectures, deep learning models, or agentic frameworks must comply with ethical principles:

1. **Safety and Robustness**: Architectures must include explicit mechanisms to prevent hallucinated conclusions, prompt injection attacks, and unverified data leakage.
2. **Explainability & Traceability**: Decision outputs must be auditable. Every decision, whether positive or negative, must be traceable to underlying evidence.
3. **Data Privacy**: All training datasets and user interactions must comply with GDPR standards. No sensitive personal identifiers may be exposed to external third-party endpoints without anonymization.

Section 2: Dual-Use and Security Screening

Proposals developing autonomous systems capable of dual-use military weaponization or cybersecurity subversion must declare an explicit security management protocol. Failure to disclose dual-use risk warrants immediate red flagging by the evaluation committee.
